

Tayagorn Manorat

Business Intelligence Analyst

Charleston, SC · 954-494-4968 · tayagornm@gmail.com · linkedin.com/in/tayagornm · tayagorn.com

BI analyst with experience building production Power BI reports, SQL pipelines, and Power Platform solutions in a defense manufacturing environment. Comfortable working across the stack, from data modeling and ETL to Power Apps and Power Automate, and equally comfortable communicating with technical teams and business stakeholders. Builds production AI systems outside of work, including MCP integrations that connect LLMs to live data.

EXPERIENCE

Business Intelligence Analyst Leonardo DRS *Aug 2024 – Present | Melbourne, FL (Remote)*

- Built 15+ Power BI dashboards replacing manual Excel and pivot workflows for ops and production leadership, providing daily self-service visibility into scrap, yield, and capacity KPIs
- Redesigned Power BI semantic models and migrated logic into SQL views, cutting dataset refresh time from 60 to 8 minutes while improving reliability and audit support
- Wrote SQL transformation logic to normalize and reconcile 12M+ rows across Cognos and modern platforms, creating unified datasets for 20+ cross-departmental stakeholders used for compliance and strategic planning
- Built a production planning tool that takes a top-level part number, traverses the full bill of materials, and calculates scrap and yield rates for each component, replacing a quarterly manual process
- Built Power Automate flows including form-submission alerts and a SharePoint file sync that monitors a folder, identifies the latest file by name, and auto-replaces the target document
- Built three Power Apps: an audit form with field validation across 5 audit types, a SharePoint-driven project catalog filterable by business group (PM, Quality, Operations, Finance), and a notes-capture app embedded in Power BI to work around its read-only limitation
- Built a WIP tracking report off the MES surfacing due dates and projected completion for every production step, giving program supervisors visibility they did not have before
- Partnered with engineering, operations, and finance to gather requirements, validate KPI definitions, and write process documentation aligned to regulatory objectives

Business Intelligence Intern Leonardo DRS *May – Aug 2024 | Melbourne, FL*

- Built Power BI dashboards with automated refresh and gateway config for near real-time warehouse and WIP aging visibility
 - Wrote a Python script to auto-refresh shop floor displays on a schedule; Power BI refreshes data in the background but does not reload the page, so engineers were manually cycling it with a wireless keyboard
 - Built an Excel/VBA genealogy tool using SQL CTEs to map full product traceability, supporting contract lifecycle documentation and reducing manual lookup time
 - Migrated local Power BI reports to Power BI Service with gateway refreshes, improving reliability and enabling cross-team access
 - Performed data quality checks and validation on legacy system exports during system transitions, maintaining data security protocols throughout
-

PROJECTS

NOVA AI Health Coaching System *Personal project* | health.tayagorn.com

- Built an AI coaching system that ingests WHOOP, Apple Health, and FatSecret data into a 20+ table SQLite database (1.5M+ records) via Python pipelines on cron, handling OAuth 1.0a and OAuth 2.0 token flows including auto-rotating refresh tokens
- Built an MCP (Model Context Protocol) server exposing 16+ tools that give Claude live access to recovery, nutrition, and body composition data, deployed as a systemd service behind an nginx reverse proxy with SSL
- Designed a versioned goals engine using append-only SQL with separate weekday and weekend targets, powering scheduled AI routines that send personalized morning briefs and weekly reviews through Pushover notifications
- Built a public Grafana dashboard for weight, macro, and recovery trends, plus an iOS Shortcut endpoint that ingests live smart scale data; designed model agnostic so the system can run on any LLM

PolyKalshi Weather Arb Scanner *Personal project* | polykalshidash.tayagorn.com

- Polls Polymarket and Kalshi temperature contracts every 30 seconds across NYC, Chicago, and Miami, comparing market-implied probabilities to a prediction model to find mispriced contracts
- Temperature model blends NWS forecasts with 10 years of NOAA climatology and real-time observed temps, feeding 5 parallel paper-trading strategies with Kelly criterion sizing, each A/B tested against an independent virtual bankroll
- Deployed on DigitalOcean via Docker Compose with PostgreSQL, a Streamlit dashboard showing live predictions and trade history, and a versioned SCP/SSH deploy process across 16 iterations
- Built through Claude Code, directing architecture and product decisions and using AI to implement and debug end-to-end

EDUCATION & CERTIFICATIONS

B.S. Management Information Systems & Marketing Florida State University, 2024, Magna Cum Laude

Microsoft Office Specialist (Excel) · SQL Bootcamp, Udemy · P3 Adaptive Advanced Power BI

SKILLS

Tools: Power BI, Power Apps, Power Automate, Power BI Service, SharePoint, Microsoft Lists, Excel (Advanced), Cognos, Tableau, Docker, DigitalOcean, GitHub

Data & SQL: SQL (T-SQL, SQL Server), Python, DAX, Power Query (M), ETL/ELT, Semantic Modeling, Data Validation

AI: Claude, Claude Code, MCP Server Development, LLM Tool Integration, Prompt Engineering, ChatGPT

Other: Requirements Gathering, Root Cause Analysis, Stakeholder Communication, Audit Support, Process Documentation
